## SYNOPSIS

The Parking Management System is a web-based application designed to improve parking on college campuses. It helps students, faculty, and visitors find and secure parking spaces more easily in the busy parking area of the college.

The system shows real-time information about available parking spots across campus. This feature is especially helpful for students and faculty who are in a hurry to get to their classes or lectures. They can quickly check the app to find open spots, which saves time and reduces stress. Users can also book parking spaces ahead of time, which is useful for students with changing schedules or for days when there are special events on campus.

The system is easy to use. It has simple sign-up and login processes, and includes a password reset option for those who forget their login details. The design is simple enough for new students to use without trouble. The system works well on both computers and smartphones, so people can use it wherever they are.

For the staff who manage campus parking, the system offers helpful tools. They have a dashboard where they can see all parking activities, manage bookings, and deal with any problems that users report. This helps them make better use of the parking spaces, reduce unauthorized parking, and improve traffic flow on campus.

The system also lets users report problems. Students and faculty can easily let staff know about issues like broken parking gates or safety concerns. This helps the staff fix problems quickly and makes parking safer and more reliable.

The Parking Management System uses current web technologies. The part that users see is made with React and TypeScript, which makes it responsive and easy to use. The behind-the-scenes part uses Flask, a Python tool that can handle many users at once. This is important during busy times like the start of semesters or during big campus events.

By using this system, colleges can make daily life easier for students and staff. It reduces the hassle of finding parking, so people can focus more on their studies and work. It also gives the college useful information about how parking spaces are being used, which helps with planning.

Overall, this Parking Management System makes an often frustrating part of campus life much smoother. It's a step towards making campuses more efficient and connected, which improves the college experience for everyone.

## CHAPTER 1: INTRODUCTION

Parking on college campuses has long been a challenge for students, faculty, and visitors. With limited spaces and high demand, especially during peak hours, finding a parking spot can be time-consuming and stressful. This often leads to tardiness, frustration. Traditional parking management systems rely on manual oversight.

The Parking Management System is designed to address these issues by using modern technology to streamline the parking process on college campuses. Its main goal is to simplify parking space allocation, reduce the time spent searching for available spots, and provide a better overall parking experience for the campus community.

This system is tailored for college environments and caters to students, faculty members, campus visitors, and parking administration staff. It covers various aspects of parking management, from real-time availability tracking to complaint handling, creating a comprehensive solution for campus parking needs.

Functionalities:

- User authentication with signup, login, and password recovery options
- Real-time tracking and display of available parking spots
- A booking system allowing users to reserve parking spaces in advance
- An admin dashboard for overseeing parking operations
- A complaint management module for reporting and addressing issues
- Responsive design ensuring accessibility on both desktop and mobile devices

By implementing this Parking Management System, colleges can expect several benefits. It will significantly reduce the time and stress associated with finding parking, improve overall campus traffic flow, and provide valuable data for future parking infrastructure planning. Additionally, the system's automated nature will decrease the workload on administrative staff.

## CHAPTER 2: SYSTEM REQUIREMENTS

### 2.1. Hardware Requirements

#### For Server:

- Processor: Multi-core processor (e.g., Intel Core i5 or equivalent)
- RAM: 8GB or more
- Storage: 50GB or more of available space
- Network: Stable internet connection

#### For Users:

- Any device capable of running a modern web browser
- Stable internet connection

### 2.2. Software Requirements

#### For Server:

- **Operating System:** Linux (Ubuntu 20.04 LTS or later recommended), Windows Server 2016 or later, or macOS
- **Web Server:** Nginx or Apache
- **Database:** MySQL 5.7 or later
- Python 3.8 or later
- Node.js 14 or later

#### For Development:

- Python 3.8 or later
- Node.js 14 or later
- npm

- Git for version control

**For Users:**

- Modern web browser (Chrome, Firefox, Safari, or Edge)
- JavaScript enabled

**Additional Software:**

- Flask 2.0 or later
  - React 17 or later
  - TypeScript 4.0 or later
  - SQLAlchemy 1.4 or later
-

## CHAPTER 3: SYSTEM DESIGN

### 3.1. System Design

The Parking Management System is built on a client-server architecture, utilizing modern web technologies to provide a responsive and efficient parking management solution.

#### **Frontend:**

The frontend is developed using React with TypeScript, providing a dynamic and responsive user interface. Important frontend components include:

- User authentication pages (login, signup, forgot password)
- Dashboard for viewing and booking parking slots
- Admin dashboard for managing bookings and complaints
- Complaint submission form

The frontend communicates with the backend via RESTful APIs using Axios for HTTP requests. Tailwind CSS and Radix UI are used for styling, ensuring a consistent user interface across devices.

#### **Backend:**

The backend is powered by Flask, a Python web framework, which handles business logic, data processing, and database interactions. Important backend components include:

- User authentication and authorization
- Parking slot management
- Booking system
- Complaint handling
- Admin functionalities

SQLAlchemy is used as the Object-Relational Mapping (ORM) tool, enabling efficient interactions with the MySQL database. Flask-CORS is implemented to handle cross-origin resource sharing, allowing the frontend to communicate securely with the backend.

**Data Flow:**

1. User interacts with the React frontend (e.g., booking a parking slot)
2. Frontend sends a request to the corresponding Flask API endpoint
3. Flask backend processes the request, interacts with the database via SQLAlchemy
4. Backend sends a response back to the frontend
5. React updates the UI based on the received data

**Design Patterns and Principles:**

- Model-View-Controller (MVC) pattern is used to separate concerns
- RESTful API design for clear and standardized communication
- Modular architecture for easier maintenance and scalability

**Security Considerations:**

- User authentication with secure password hashing
- HTTPS for encrypted data transmission
- Input validation to prevent SQL injection and XSS attacks
- Flask-Mail for secure email functionality (password reset)

This design allows for efficient development, easy maintenance, and scalability to accommodate growing user bases and parking management needs.

**3.2. Model Architecture**

The Parking Management System utilizes a relational database model to efficiently manage and store data. The following are the key models in our system:

**1. User Model:**

- **Attributes:** id, name, username, email, password (hashed), is\_admin
- **Relationships:** One-to-many with Booking and Complaint models
- **Purpose:** Stores user information and credentials

**2. ParkingSlot Model:**

- **Attributes:** id, name, is\_available

- **Relationships:** One-to-many with Booking model
- **Purpose:** Represents individual parking spaces

### 3. Booking Model:

- **Attributes:** id, user\_id, slot\_id, start\_time, end\_time, vehicle\_type
- **Relationships:** Many-to-one with User and ParkingSlot models
- **Purpose:** Records parking space reservations

### 4. Complaint Model:

- **Attributes:** id, user\_id, slot\_name, description, status, created\_at
- **Relationships:** Many-to-one with User model
- **Purpose:** Tracks user-reported issues or complaints

### 5. PasswordReset Model:

- **Attributes:** id, user\_id, token, expires\_at
- **Relationships:** Many-to-one with User model
- **Purpose:** Manages password reset requests

These models are implemented using SQLAlchemy ORM, which allows for easy interaction with the MySQL database. The relationships between models are as follows:

- A User can have multiple Bookings and Complaints
- A ParkingSlot can have multiple Bookings
- Each Booking is associated with one User and one ParkingSlot
- Each Complaint is associated with one User
- PasswordReset tokens are associated with a specific User

This model architecture allows for efficient querying and management of parking-related data, supporting features such as real-time availability tracking, user-specific booking history, and complaint management.

## 3.3. Module Inference

The Parking Management System is composed of several interconnected modules that work together to provide a comprehensive parking solution. Here's an overview of the main modules and their interactions:

### 1. User Authentication Module:

- Handles user registration, login, and password reset

- Interacts with the User and PasswordReset models
- Communicates with the frontend to manage user sessions

## **2. Parking Slot Management Module:**

- Manages the status and availability of parking slots
- Interacts with the ParkingSlot model
- Provides real-time updates to the frontend on slot availability

## **3. Booking Module:**

- Processes parking slot reservations and cancellations
- Interacts with the Booking, User, and ParkingSlot models
- Communicates with the frontend to display booking information and handle user requests

## **4. Complaint Management Module:**

- Handles the submission and tracking of user complaints
- Interacts with the Complaint and User models
- Provides interfaces for users to submit complaints and for admins to manage them

## **5. Admin Dashboard Module:**

- Offers an interface for system administrators to manage the entire system
- Interacts with all models to provide comprehensive management capabilities
- Communicates with the frontend to display admin-specific views and controls

## **6. Notification Module:**

- Manages email notifications for password resets, booking confirmations, etc.
- Interacts with the User model and uses Flask-Mail for sending emails

## **Module Interactions:**

- The User Authentication Module verifies user credentials before allowing access to other modules
- The Booking Module checks with the Parking Slot Management Module for

availability before confirming a reservation

- The Admin Dashboard Module interacts with all other modules to provide system-wide management capabilities
- The Notification Module is triggered by actions in other modules (e.g., new bookings, password reset requests)

This modular architecture allows for:

- Separation of concerns, making the system easier to maintain and update
- Scalability, as individual modules can be optimized or expanded as needed
- Flexibility in adding new features by introducing new modules or enhancing existing ones

The interaction between these modules ensures a seamless user experience, from authentication to booking a parking slot and managing any issues that may arise.

### **3.4. System Flow**

The Parking Management System employs a client-server architecture, separating the frontend user interface from the backend server logic.

#### **System Flow:**

##### **1. User Access:**

- User accesses the application via web browser
- React app loads and initializes the frontend interface

##### **2. Authentication:**

- User enters credentials on the login page
- Frontend sends login request to Flask backend
- Backend validates credentials and returns JWT token
- Frontend stores token for subsequent authenticated requests

##### **3. Parking Slot Booking Process:**

###### **a. Viewing Available Slots:**

- Frontend requests available parking slots from backend
- Backend queries database and returns slot information
- React components render the available slots

**b. Booking a Slot:**

- User selects a slot and submits booking request
- Frontend sends booking details to backend API
- Backend validates request, checks slot availability
- If valid, backend creates a new booking record in database
- Backend sends confirmation response to frontend
- React updates UI to show booking confirmation

**4. Complaint Submission:**

- User fills out complaint form on frontend
- Frontend sends complaint data to backend API
- Backend creates new complaint record in database
- Backend triggers email notification to admin (via Flask-Mail)
- Frontend displays confirmation message to user

**5. Admin Operations:**

- Admin logs in with special credentials
- Backend recognizes admin role and grants elevated permissions
- Admin dashboard loads with options for user management, booking overview, and complaint handling
- Each admin action (e.g., resolving a complaint) triggers appropriate backend API calls and database updates

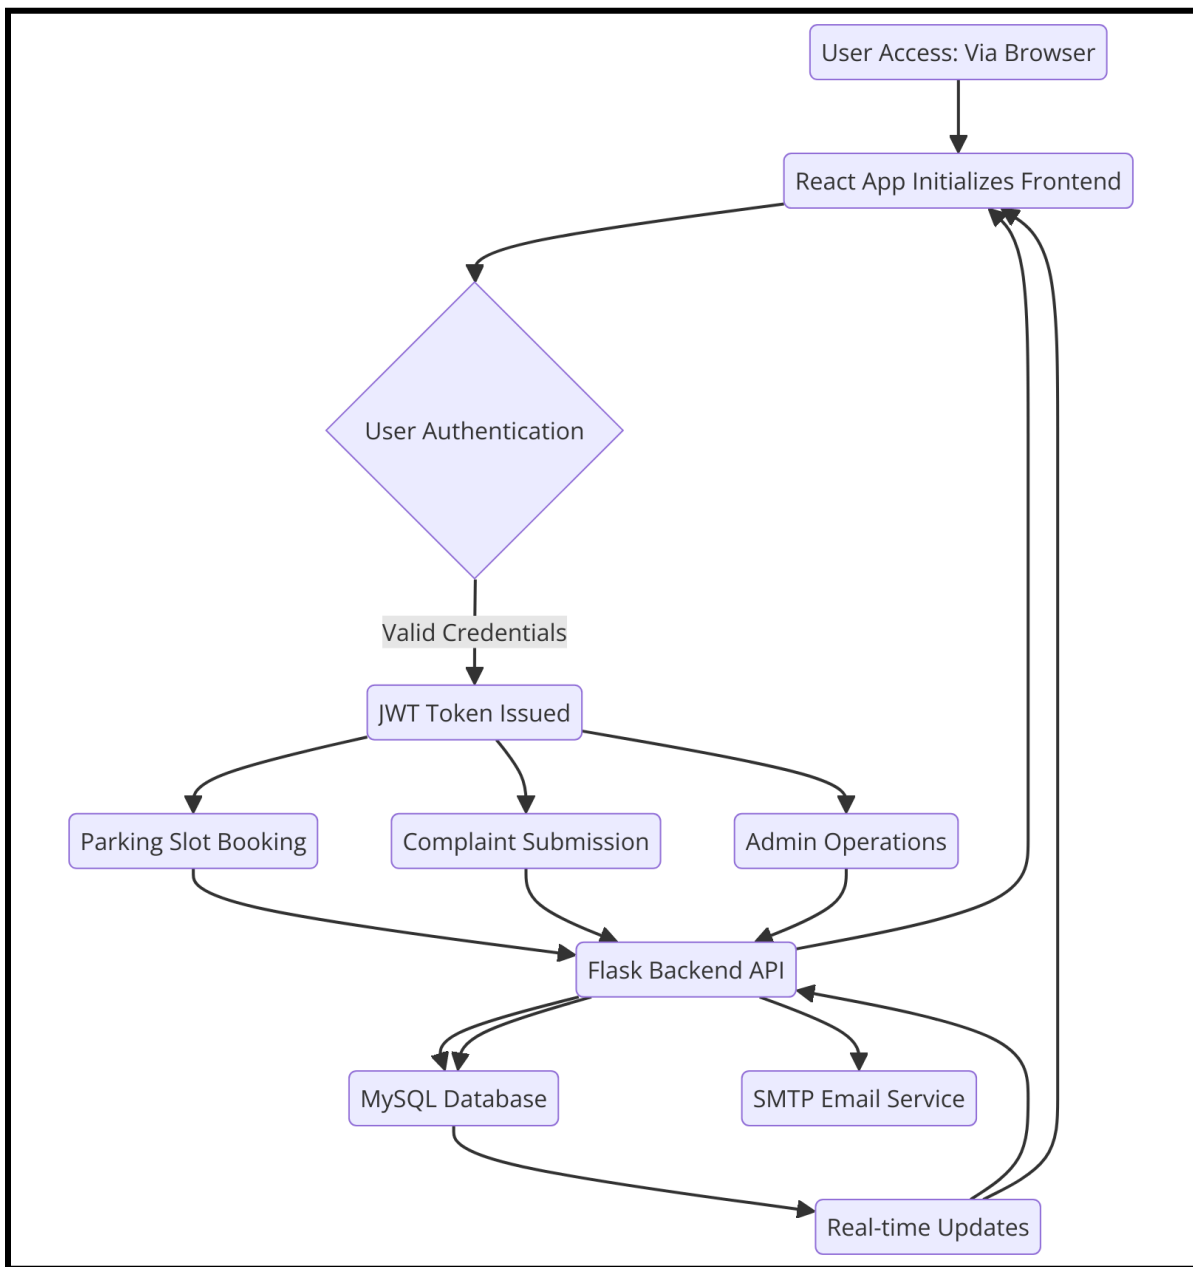

**6. Real-time Updates:**

- Frontend periodically polls backend for updates on parking slot availability
- Backend checks database and returns current status
- React components re-render to reflect the latest availability

**Data Flow:**

1. User Input → React Components → Axios HTTP Request
2. HTTP Request → Flask Server → Business Logic Processing
3. Business Logic → SQLAlchemy ORM → MySQL Database

4. Database Response → Flask Server → HTTP Response
5. Axios receives response → React State Update → UI Re-render

This architecture ensures clear separation of concerns, with the frontend handling all user interactions and display logic, while the backend manages data processing, storage, and business logic implementation. The use of RESTful APIs allows for scalability and potential future expansion to mobile applications or third-party integrations.

## CHAPTER 4: SYSTEM IMPLEMENTATION

### 4.1. System Architecture and Implementation in Detail

The Parking Management System is architected using a client-server model, clearly delineating responsibilities between the frontend user interface and the backend server logic. This separation ensures maintainability, scalability, and efficient management of system resources.

#### Frontend Architecture:

- **Technology Stack:**

- **React with TypeScript:** Utilized for building a dynamic and interactive user interface. TypeScript adds static typing to JavaScript, enhancing code reliability and developer productivity.
- **Tailwind CSS:** Employed for rapid and efficient styling, allowing for consistent and responsive designs across various components.
- **Radix UI:** Provides unstyled, accessible UI primitives that can be customized to fit the system's design requirements.
- **Axios:** Configured for handling HTTP requests, enabling seamless communication with the backend APIs.

- **Component Structure:**

- **Modular Components:** The UI is divided into reusable React components such as ParkingSlotCard, TimePicker, BookingForm, and ComplaintForm. This modularity promotes reusability and simplifies maintenance.
- **State Management:** Utilizes React's useState and useContext hooks to manage both local and global application state, ensuring synchronized data across components.
- **Routing:** Implemented using React Router to facilitate navigation between different views like Login, Dashboard, Admin Panel, and Complaint Submission pages.

- **User Interaction Workflow:**

- **Authentication:** Users access the system through Login or Signup pages. Upon successful authentication via backend APIs, they are redirected to the Dashboard.
- **Viewing Parking Slots:** The Dashboard displays real-time availability of parking slots fetched from the backend.
- **Booking a Slot:** Users select an available slot, choose their vehicle type, and specify parking times through the Booking Form. This data is sent to the backend for processing.
- **Submitting Complaints:** Users can report issues via the Complaint Form, which sends the complaint details to the backend for resolution.
- **Admin Management:** Administrators access the Admin Panel to manage bookings and address complaints using the backend-provided APIs.

## **Backend Architecture:**

- **Technology Stack:**

- **Flask:** Serves as the primary backend framework, handling HTTP requests, routing, and business logic.
- **SQLAlchemy ORM:** Facilitates interaction with the MySQL database, allowing for efficient data manipulation and query execution.
- **Flask-CORS:** Manages Cross-Origin Resource Sharing, enabling secure interactions between the frontend and backend hosted on different origins.
- **Flask-Mail:** Integrates email functionalities for sending notifications such as password resets and booking confirmations.

- **Application Structure:**

- **Blueprints:** The backend is organized using Flask blueprints (e.g., auth, booking, admin), promoting modularity and scalability.
- **Factory Pattern:** Implements the factory pattern to create Flask application instances, enhancing configurability and testing capabilities.

- **RESTful API Endpoints:** Defines clear and logical API routes for different functionalities, adhering to RESTful principles for standardized communication.
- **Business Logic:**
  - **Authentication and Authorization:** Uses JWT (JSON Web Tokens) to manage secure user sessions, ensuring that protected routes are accessible only to authenticated users.
  - **Booking Management:** Handles the creation, updating, and cancellation of parking bookings, ensuring that slot availability is accurately maintained.
  - **Complaint Handling:** Manages user-submitted complaints, allowing administrators to view and resolve issues efficiently.
- **Security Measures:**
  - **Password Hashing:** Utilizes secure hashing algorithms (e.g., bcrypt) to store user passwords safely.
  - **Input Validation:** Implements strict input validation to prevent common vulnerabilities such as SQL injection and Cross-Site Scripting (XSS).
  - **HTTPS:** Ensures that all data transmission between the frontend and backend occurs over secure HTTPS channels.

### Database Integration:

- **Database Design:**
  - The system employs a MySQL database with tables corresponding to the main data models: Users, ParkingSlots, Bookings, Complaints, and PasswordResets.
  - Relationships:
    - A User can have multiple Bookings and Complaints.
    - A ParkingSlot can have multiple Bookings.
    - Each Booking is associated with one User and one ParkingSlot.

- **Data Operations:**

- **CRUD Operations:** Leveraging SQLAlchemy, the backend efficiently performs Create, Read, Update, and Delete operations on the database.
- **Transactions:** Ensures data integrity through transactional operations, particularly during booking processes where multiple related records are updated.

## API Design:

- **RESTful Principles:**

- The API adheres to RESTful design, using standard HTTP methods (GET, POST, PUT, DELETE) for different operations.
- **Endpoint Naming:** Resources are logically named, e.g., /api/users, /api/bookings, /api/complaints, facilitating intuitive API usage.

- **Response Handling:**

- Consistent JSON responses with appropriate HTTP status codes are implemented to convey success or error states to the frontend.
- **Error Messages:** Meaningful error messages are provided to aid in debugging and improving user experience.

- **Authentication:**

- Protected routes require a valid JWT token, ensuring that only authorized users can access sensitive endpoints.

## Deployment Considerations:

- **Frontend Deployment:**

- The React application is built into static files and can be served using a web server like Nginx or through cloud services like Netlify or Vercel for scalability and performance.

- **Backend Deployment:**

- The Flask application is deployed using a WSGI server such as Gunicorn, often behind a reverse proxy like Nginx to handle load balancing and SSL termination.

- **Database Hosting:**

- The MySQL database is hosted on a dedicated server or cloud-based database service, ensuring high availability and scalability.

- **Environment Configuration:**

- Environment-specific settings (e.g., development, testing, production) are managed using environment variables, enhancing security and flexibility.

- **Scalability and Reliability:**

- The system is designed to scale horizontally by adding more server instances to handle increased load.
- Load balancing and failover strategies are implemented to ensure high availability and reliability.

## 4.2. Challenges and Solutions

During the implementation of the Parking Management System, several challenges were encountered. This subsection outlines these challenges and the solutions devised to overcome them.

### 1. Handling Real-time Updates:

- **Challenge:** Ensuring that parking slot availability updates in real-time to provide accurate information to users.
- **Solution:** Implemented a polling mechanism on the frontend using `useEffect` to periodically fetch the latest parking slot data from the backend, refreshing the UI accordingly. In future iterations, integrating WebSockets could provide even more instantaneous updates.

### 2. Secure Authentication:

- **Challenge:** Protecting user data and ensuring secure authentication protocols.
- **Solution:** Utilized JWT for stateless authentication, ensuring that tokens are securely stored and validated with each request. Passwords are hashed using `bcrypt` before being stored in the database, adding an extra layer of security.

### 3. Database Optimization:

- **Challenge:** Managing efficient database queries to handle a large number of users and bookings without performance degradation.
- **Solution:** Optimized database indices on frequently queried fields, such as *slot\_id* and *user\_id*, to speed up lookup times. Employed SQLAlchemy's lazy loading to prevent unnecessary data retrieval, enhancing overall performance.

### 4. Responsive Design Implementation:

- **Challenge:** Creating a user interface that works seamlessly across various devices and screen sizes.
- **Solution:** Leveraged Tailwind CSS's responsive utility classes to design a flexible layout that adjusts to different screen sizes. Testing was conducted on multiple devices to ensure consistency and usability.

### 5. Error Handling and User Feedback:

- **Challenge:** Providing meaningful feedback to users in case of errors, such as failed bookings or invalid inputs.
- **Solution:** Implemented comprehensive error handling on both frontend and backend. Custom error messages are returned from the backend and displayed on the frontend using state variables, informing users of the specific issues encountered.

### 6. Managing State Across Components:

- **Challenge:** Synchronizing state across multiple components, especially in a dynamic application with frequent data updates.
- **Solution:** Employed React's Context API to manage global state, ensuring that updates to one component are reflected across the application. This approach simplifies state management and enhances data consistency.

### 7. Integration of Email Services:

- **Challenge:** Ensuring reliable email delivery for notifications like password resets and booking confirmations.

- **Solution:** Configured Flask-Mail with a reliable SMTP server, implementing retry mechanisms to handle transient email delivery failures. Tested email functionalities thoroughly to ensure deliverability.

## 8. Scalability Considerations:

- **Challenge:** Designing the system to handle increased loads, particularly during peak usage times such as the start of semesters.
- **Solution:** Designed the backend to be stateless, allowing for horizontal scaling by adding more server instances behind a load balancer. Database connections are managed efficiently to support concurrent access without bottlenecks.

## 9. Managing Concurrent Bookings:

- **Challenge:** Ensuring that multiple users could not book the same parking slot simultaneously, leading to overbooking.
- **Solution:** Implemented database-level transaction locks and backend logic to check slot availability atomicity before confirming bookings.

By addressing these challenges with thoughtful solutions, the Parking Management System achieves a balance between functionality, performance, and user experience. The implementation strategies employed ensure that the system is robust, secure, and scalable, effectively meeting the needs of its users and administrators.

## 4.3 Testing and Optimization

### Unit Testing:

- **Objective:** Verify the functionality of individual components and functions in isolation.
- **Frontend:** Tested React components. Tests focused on rendering components correctly, handling user interactions, and managing state changes.
- **Backend:** Tested Flask routes, utility functions, and database interactions. Tests ensured that API endpoints responded correctly to valid and invalid requests.

### **Integration Testing:**

- **Objective:** Assess the interactions between different modules and components to ensure they work seamlessly together.
- **Frontend-Backend Interaction:** Tested the communication between the React frontend and Flask backend using Postman. This involved sending requests to API endpoints and validating the responses.
- **Database Operations:** Verified that data flows correctly from the backend to the database and vice versa, ensuring data integrity and proper handling of CRUD operations.

### **End-to-End (E2E) Testing:**

- **Objective:** Simulate real user scenarios to validate the complete functionality of the system.
- Scenarios included user registration, login, booking a parking slot, submitting a complaint, and admin managing bookings and complaints.
- These tests helped identify and rectify issues that might arise during actual user interactions.

### **Test Cases:**

Test cases were developed to cover all critical aspects of the system:

- **User Authentication:**
  - Test cases included user registration with valid and invalid data, login with correct and incorrect credentials, and password reset functionality.
- **Booking System:**
  - Verified booking slots with valid and overlapping time ranges, cancellation of bookings, and handling of concurrent booking requests.
- **Complaint Management:**
  - Tested the submission of complaints, viewing of complaints by admins, and resolution workflows.

- **Admin Dashboard:**

- Ensured that admins could effectively manage bookings and complaints, and that role-based access control was functioning correctly.

- **Frontend Components:**

- Validated that all UI components rendered correctly, responded to user inputs, and displayed appropriate messages based on backend responses.

### **Optimization:**

To enhance the system's performance and ensure a smooth user experience, several optimization strategies were implemented:

#### **Frontend Optimizations:**

- **Code Splitting:** Implemented using React's lazy loading and Suspense to reduce initial load times by splitting the code into smaller chunks.
- **Memoization:** Utilized React.memo and useMemo hooks to prevent unnecessary re-renders of components, improving rendering performance.
- **Efficient State Management:** Adopted React's Context API judiciously to avoid excessive state updates and reduce component re-rendering.

#### **Backend Optimizations:**

- **Database Indexing:** Added indexes to frequently queried fields such as user\_id and slot\_id in the database to speed up query execution.
- **Query Optimization:** Refactored complex SQL queries to be more efficient, reducing load times and server strain.
- **Caching:** Implemented caching strategies using Flask-Caching to store frequently accessed data in memory, minimizing database hits and enhancing response times.

#### **API Performance Enhancements:**

- **Asynchronous Processing:** Leveraged asynchronous programming in Flask for handling I/O-bound operations, improving the ability to manage multiple requests concurrently.

- **Compression:** Enabled gzip compression on API responses using Flask-Compress to reduce payload sizes and accelerate data transmission.

#### Security Enhancements:

- **Secure Headers:** Configured security-related HTTP headers using Flask-Talisman to protect against common web vulnerabilities.
- **Rate Limiting:** Implemented rate limiting using Flask-Limiter to prevent brute-force attacks and ensure fair usage of system resources.

#### Results of Testing and Optimization:

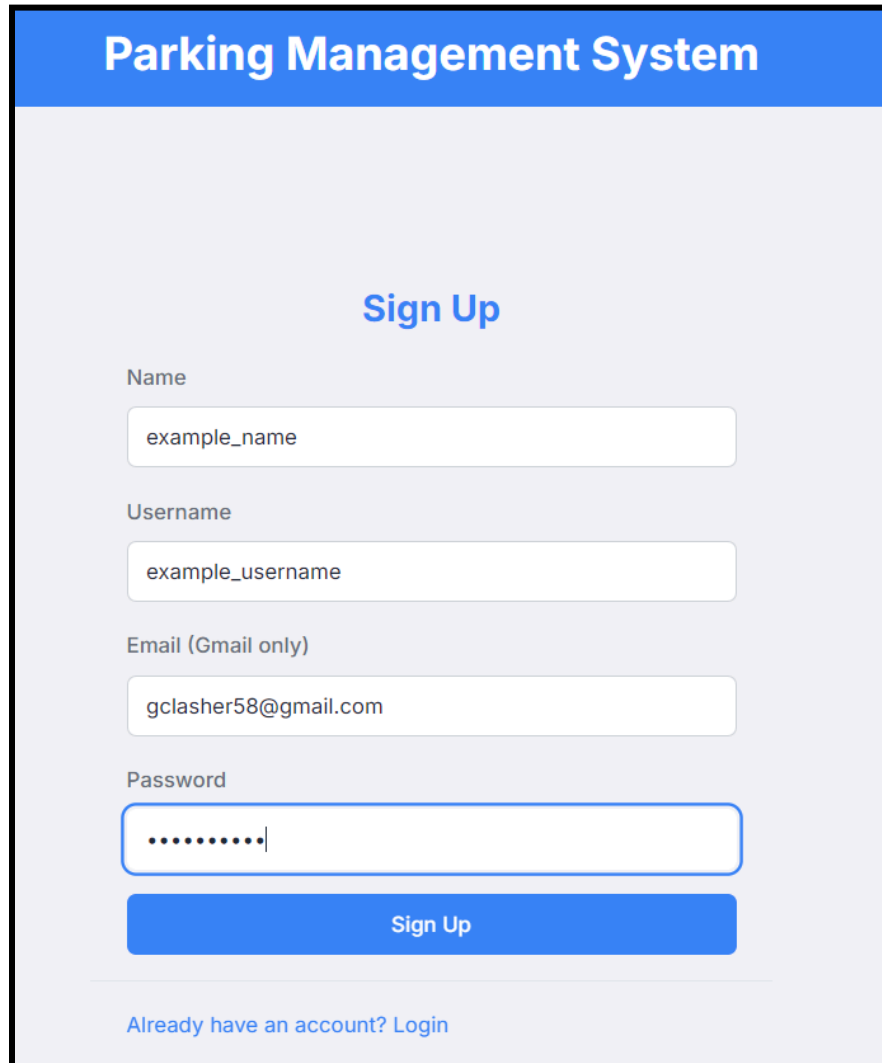

- **Increased Stability:** The system demonstrated high stability under simulated high-load conditions, with minimal crashes or slowdowns.
  - **Enhanced Performance:** Load times for API responses were reduced after optimizations, leading to a more responsive user experience.
  - **Improved Scalability:** The backend proved capable of handling increased traffic through horizontal scaling, maintaining consistent performance.
  - **Better User Experience:** Optimizations on the frontend resulted in faster rendering times and smoother interactions, contributing to higher user satisfaction.
  - **Robust Security:** Enhanced security measures effectively protected the system against common vulnerabilities, ensuring data integrity and user privacy.
-

## CHAPTER 5: RESULTS

### 1. User Authentication

#### a. User Registration

- **Test Case:** Registering a new user with valid details.

The screenshot displays the 'Sign Up' interface of a 'Parking Management System'. The system title is in a blue header bar. Below it, the 'Sign Up' heading is centered. The form contains four input fields: 'Name' (with 'example\_name'), 'Username' (with 'example\_username'), 'Email (Gmail only)' (with 'gclasher58@gmail.com'), and 'Password' (with masked characters '.....'). A blue 'Sign Up' button is positioned below the password field. At the bottom, a link reads 'Already have an account? Login'.

[Already have an account? Login](#)

The screenshot shows a web application interface. At the top, a white notification box with a blue border contains the text "localhost:3000 says" and "Signup successful", with a blue "OK" button. Below this, the "Sign Up" form is displayed on a light blue background. The form includes four input fields: "Name" (containing "example\_name"), "Username" (containing "example\_username"), "Email (Gmail only)" (containing "gclasher58@gmail.com"), and "Password" (containing eight dots). A blue "Sign Up" button is positioned below the password field. At the bottom of the form, there is a link that says "Already have an account? Login".

- Stored in the database successfully

5	Admin	admin	admin@example.com	bcrypt:32768:8:1\$cdngkvc0s0dyppu\$10955e...	1
6	example_name	example_username	gclasher58@gmail.com	bcrypt:32768:8:1\$dwWemdtBQAZbwaU2\$bddd...	0

- **Result:**
  - The system successfully created a new user account.

- **Test Case:** Registering with an already existing email or username.

The image shows a web form titled "Sign Up" in blue text. Below the title are four input fields: "Name" with the value "example\_name", "Username" with the value "example\_username", "Email (Gmail only)" with the value "gclasher58@gmail.com", and "Password" with masked characters ".....". Below these fields is a red error message: "Signup failed. Please try again." At the bottom of the form is a blue button labeled "Sign Up". Below the button, there is a link that says "Already have an account? Login".

- **Result:**
  - The system correctly rejected the registration request.

## b. User Login

- **Test Case:** Logging in with correct credentials.

- **Result:**
  - The system authenticated the user successfully.
  - The user was redirected to the Dashboard.
  - A JWT token was stored in localStorage for session management.
- **Test Case:** Logging in with incorrect credentials.

The screenshot displays the login interface of a 'Parking Management System'. At the top, a blue header contains the title 'Parking Management System' in white. Below this, the word 'Login' is centered in a large blue font. The form consists of two input fields: 'Username or Email' and 'Password'. The 'Username or Email' field contains the text 'wrong\_username'. The 'Password' field is filled with ten dots. Below the password field, a red error message reads 'Invalid username or password'. A blue 'Log In' button is positioned below the error message. At the bottom of the form, there are two links: 'Forgot Password?' in blue and 'Don't have an account? Sign Up' in green.

- **Result:**
  - The system denied access as expected.

- An error message was displayed indicating invalid username or password.

### c. Password Reset

- **Test Case:** Initiating a password reset with a registered email.

Below the header, the page has a light gray background. In the center, the text "Reset Password" is shown in blue. There are two input fields: "New Password" and "Confirm Password", both containing masked text (dots). Below these fields is a blue button labeled "Reset Password". At the bottom, a message states "Password reset successful. Redirecting to login..." in a smaller, gray font.

- **Result:**
  - The system sent a password reset email to the user's email address without delay.
  - A success message was displayed, informing the user to check their email.
  - Mail received for the password reset, which redirects the user to the correct page and password reset was successful.

**d. Logout**

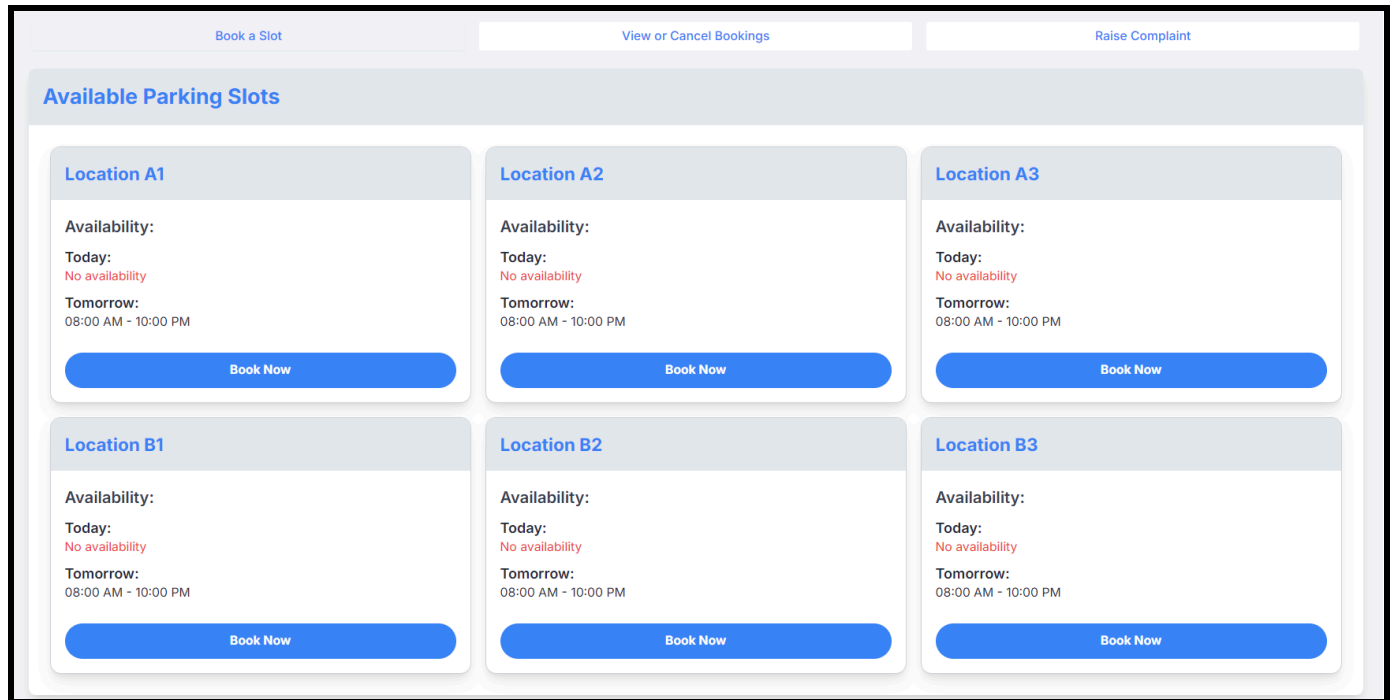

- **Test Case:** End session with the current user and re-direct to the login page.

The image displays a mockup of the 'Parking Management System' interface. At the top, a blue header bar contains the text 'Parking Management System' on the left and a 'Logout' button on the right. Below this header is a large light gray rectangular area representing the main content of the page. Inside this area, the word 'Login' is centered in a blue font. Below 'Login', there are two input fields: the first is labeled 'Username or Email' and the second is labeled 'Password'. Below these fields is a blue button labeled 'Log In'. At the bottom of the light gray area, there are two links: 'Forgot Password?' in blue and 'Don't have an account? Sign Up' in green.

- **Result:**
  - Successfully logs out to the login page.

**2. Parking Slot Management Tests****a. Viewing Available Parking Slots**

- **Test Case:** Accessing the parking slots view.

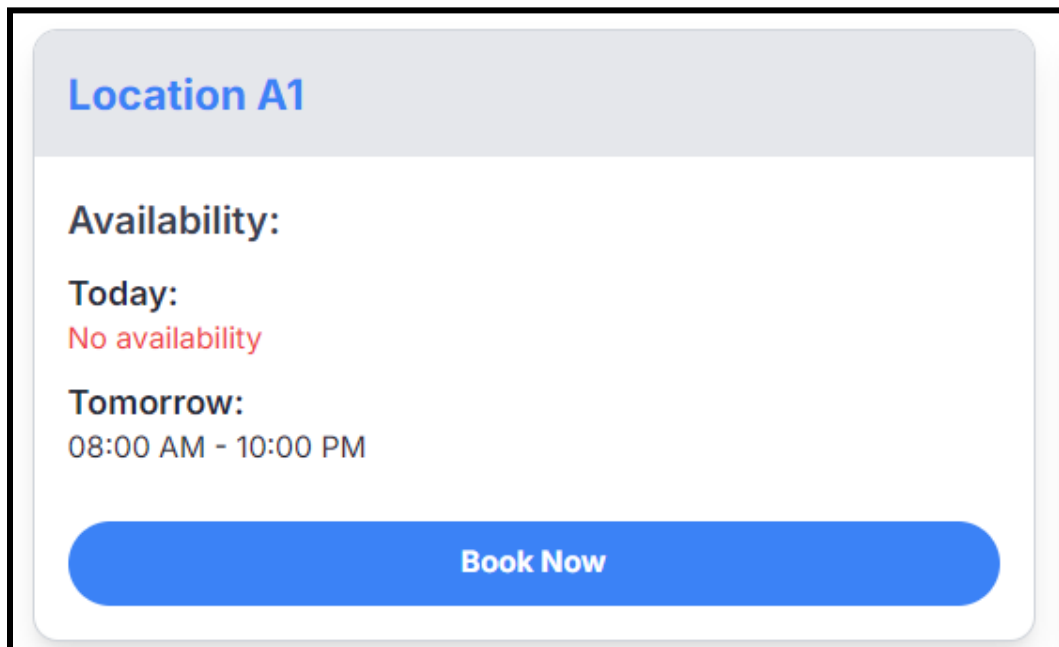

- **Result:**

- The system displayed a comprehensive list of all parking slots.
- Each slot accurately indicated its current availability status (available/booked).
- Real-time updates reflected the latest availability without requiring a page refresh.

**b. Booking a Parking Slot**

- **Test Case:** Booking an available parking slot with valid details.

## Book Parking Slot

Please enter the details to book this parking slot.

Bookings Complaints

**All Bookings**

User ID: 2
Slot: A1
10/18/2024, 11:00:00 AM - 10/18/2024, 12:00:00 PM

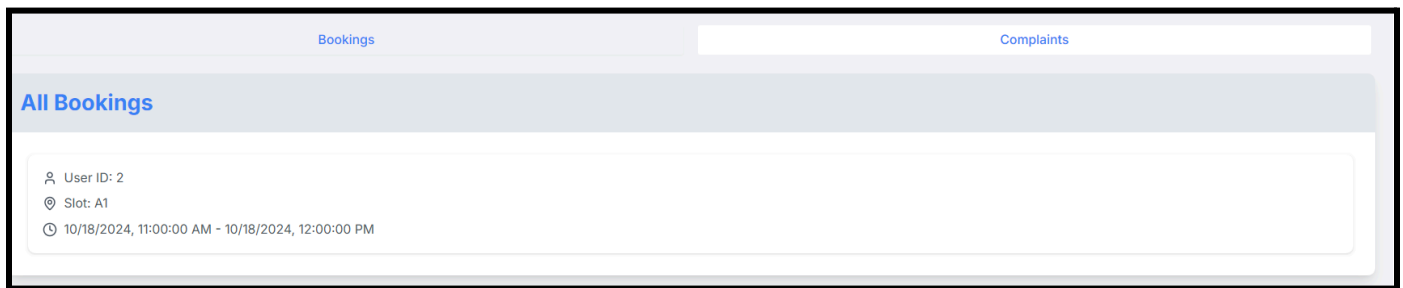

1	Admin	admin	admin@example.com	script:32768:8:1\$zBVdi3l6KjwCXfPV\$c02eb51f... 1
---	-------	-------	-------------------	---

- **Result:**

- Logs in at a special URL: <http://localhost:3000/admin/login>
- Will throw error if invalid credentials are entered
- They also have **Logout functionality**

## b. Managing Bookings

- **Test Case:** Admin viewing all bookings.

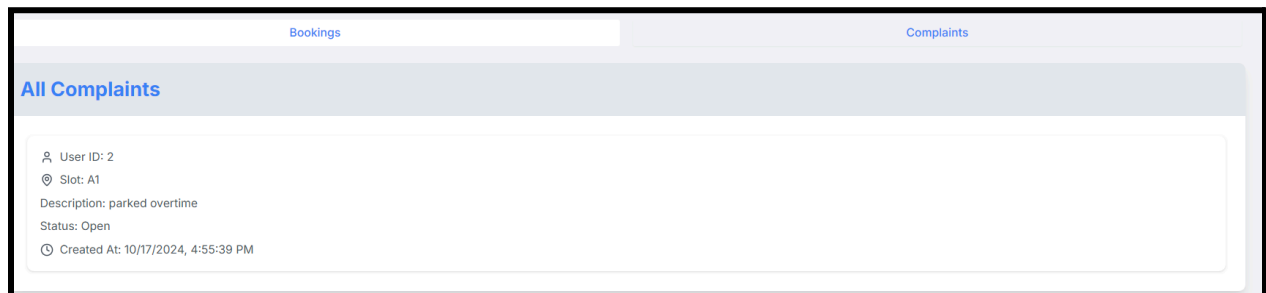

- **Result:**

- The admin could see a comprehensive list of all current and past bookings.
- Each booking entry included user details, parking slot information, and booking times.

## b. Managing Complaints

- **Test Case:** Admin viewing all bookings.

- **Result:**

- The admin could see a comprehensive list of all complaints and resolve them.
- Each complaint entry included user details, parking slot information, and booking times, description, status, created at.

## CHAPTER 6: CONCLUSION

The Parking Management System successfully addresses the common challenges associated with parking on college campuses. By providing real-time information on parking slot availability and enabling users to book spots in advance, the system significantly reduces the time and frustration often experienced by students, faculty, and visitors. The intuitive user interface, built with React and TypeScript, ensures that users can easily navigate the system and perform necessary actions without any technical difficulties. On the backend, the Flask framework coupled with SQLAlchemy ensures reliable data management and seamless interaction with the MySQL database.

Throughout the development and implementation phases, the project focused on creating a robust and scalable solution that meets the diverse needs of its users. The comprehensive testing and optimization efforts ensured that the system operates efficiently under various conditions, maintaining high performance even during peak usage times. Security measures, including secure authentication and data protection, were meticulously implemented to safeguard user information and maintain the integrity of the system. The admin dashboard provides valuable tools for campus administrators, enabling them to manage parking resources effectively and respond promptly to user complaints.

The Parking Management System has made a meaningful impact on campus parking management by streamlining the process and enhancing the overall user experience. It not only facilitates better utilization of parking spaces but also empowers administrators with the tools needed to maintain order and address issues swiftly. Moving forward, there are opportunities to further enhance the system by integrating advanced features such as mobile notifications, payment gateways for booking fees, and leveraging machine learning to predict parking availability trends. These improvements can continue to elevate the system's functionality and ensure it remains an essential tool for efficient campus parking management.

<<<<<<<< HEAD

# Parking Management System

A modern, user-friendly parking management system built with React and Flask.

## Features

- User authentication (signup, login, forgot password)
- Admin dashboard for managing bookings and complaints
- Real-time parking slot availability
- Booking system for parking slots
- Complaint management system
- Responsive design for desktop and mobile devices

## Tech Stack

### Frontend

- React
- TypeScript
- Tailwind CSS
- Radix UI
- Axios for API calls

### Backend

- Flask
- SQLAlchemy
- Flask-CORS
- Flask-Mail for email functionality

## Getting Started

### Prerequisites

- Node.js (v14 or later)
- Python (v3.8 or later)
- MySQL

### Installation

1. Clone the repository

...

```
git clone https://github.com/yourusername/parking-management-system.git
```

```
cd parking-management-system
```

```

...
2. Set up the frontend
...
cd frontend
npm install
...
3. Set up the backend
...
cd backend
python -m venv venv
source venv/bin/activate # On Windows use `venv\Scripts\activate`
pip install -r requirements.txt
...
4. Set up the database
- Create a MySQL database named `parking_management`
- Update the database connection string in `backend/app.py`
5. Set up environment variables
- Create a `.env` file in the backend directory
- Add necessary environment variables (e.g., `SECRET_KEY`, `MAIL_USERNAME`, `MAIL_PASSWORD`)
### Running the Application
1. Start the backend server
...
cd backend
flask run
...
2. Start the frontend development server
...
cd frontend
npm start
...
3. Open your browser and navigate to `http://localhost:3000`
